

The Modular Earth Submodel System (MESSy, <http://www.messy-interface.org>) source code is hosted in a GitLab repository at DKRZ and continuously further developed by the MESSy Consortium, a federation of several international institutions. Several developers and users from a variety of institutions contribute to this development. The MESSy GitLab project uses the GitLab CI/CD pipeline facility to automatically compile and test the source code for each merge request into the main developer branch. The corresponding runners require resources on the HPC system. This project provides these.
