Two timeslices in resolution T213L31 have been performed based on the coupled IPCC run for scenario A1B.

Available are the years 1959-1990 and 2069-2100.

The calculations have been performed in collaboration with the University of Kiel (Noel Keenlyside) at ECMWF and HLRN.

Basic research target are the occurrence and strength of hurricanes under future climate conditions with respect to the control period.

Initiated by Lennart Bengtsson, Mojib Latif, Erich Roeckner, Noel Keenlyside, Luis Kornblueh, and Monika Esch.
